

By Noonic

What?

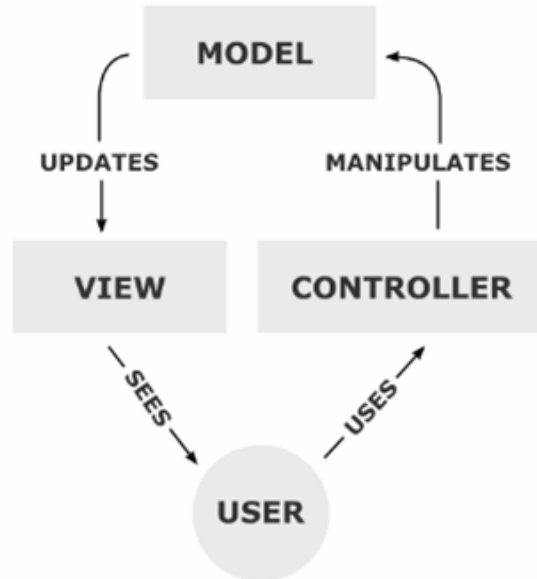

AngularJS is a client side JavaScript framework for dynamic web apps

Essentially used for SPA (Single page applications) but it can be used in regular web applications as well

Uses MVC architectural pattern

MVC architectural pattern

(I know you know MVC but still lets recall again)

Based On

Backbone JS

OOP implementation for JavaScript

jQuery

DOM manipulation

Require JS

Modular Structure

Dependency Injection

Alternatives

Knockout

Ember

... and several other

Ok, what the problem it solves actually?

Organized Code

Templating

Routing

Data Binding

Multiway

Scope

No setter or getter necessary

In short, ease of maintaining larger JavaScript code base

Concepts

Template (view)

Expression

Directives

Filter

Model

Controller

Scope

Data Binding

Dependency Injection

Module

Service

Talk is cheap, show me the code!

LETS BEGIN!

Don't be afraid
to break the rules

Thanks.
